Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	1 Mark

Problem Statement:

In the current ServiceNow Incident management process, the Incident form lacks client-side controls. Users can submit incomplete or inconsistent data, fields do not respond to the Incident State, and no real-time guidance is provided. This results in poor data quality, delayed resolution and an inconsistent user experience. This project aims to implement Client Scripts and UI Policies on the Incident form to address these issues. The table below outlines the key problem areas and the proposed approach.

S.No	Problem Area	Current Issue	Impact	Proposed Solution
1	Incomplete Incident Data	Users can submit Incident forms with missing or vague Short description and Description.	Delays in triage and repeated follow-ups with the caller.	onSubmit Client Script to validate key fields before saving.
2	Irrelevant Fields Shown	Resolution fields (Close code, Close notes) appear or stay optional regardless of Incident State.	Incidents are closed without proper resolution details.	UI Policy to show and make fields mandatory when State is Resolved/Closed.
3	Incorrect Priority Selection	Users set Urgency/Impact without guidance, leading to wrong priority.	SLA breaches and misrouted high-priority incidents.	onChange Client Script to show alerts and guidance on Urgency/Impact change.
4	Editable Fields After Creation	Fields such as Caller or Number can be modified after the Incident is created.	Data inconsistency and weak audit trail.	UI Policy to make selected fields read-only on existing records.
5	No Real-Time User Feedback	Form errors are found only after submission or on the server side.	Poor user experience and rework.	Client-side field messages and validations using g_form methods.

Objectives & Expected Outcomes:

S.No	Objective	Expected Outcome
1	Enforce mandatory and valid data entry on the Incident form.	Complete, high-quality incident records at creation.
2	Control field visibility, mandatory and read-only behavior dynamically.	A cleaner form that adapts to Incident State and user role.
3	Provide instant guidance and validation to users on the client side.	Fewer errors, faster ticket handling and improved user experience.
