

## Technology Stack

|                      |                                                |
|----------------------|------------------------------------------------|
| <b>Date</b>          | 01 October 2026                                |
| <b>Team ID</b>       | 6ab2251f18c49545982255a8                       |
| <b>Project Name</b>  | Implement Client Script & UI Policy (Incident) |
| <b>Maximum Marks</b> | 2 Marks                                        |

### Define Your Technology Stack:

Identify the programming languages, frameworks, databases, front-end tools, back-end tools, and APIs that you will use to build your solution. A well-chosen technology stack ensures that your application is scalable, maintainable, and aligned with your project requirements.

Fill out the table below to detail the specific technologies chosen for each component of your architecture and provide a brief justification for your choice.

### Technology Stack Details

| S.No | Architecture Component / Layer      | Technology Chosen                                                                                                   | Justification / Purpose                                                                                                                                                                                                                                               |
|------|-------------------------------------|---------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | <b>Frontend / Client-Side</b>       | ServiceNow Platform UI (Incident form) with Client Scripts and UI Policies, written in client-side JavaScript       | Client Scripts (onLoad, onChange, onSubmit) and UI Policies run directly in the browser on the Incident form. They give instant validation, mandatory/read-only/visible field control and a responsive, consistent user experience without extra frontend frameworks. |
| 2    | <b>Backend / Server-Side</b>        | ServiceNow server-side scripting: Business Rules and Script Includes (JavaScript with GlideRecord / GlideAjax)      | Handles server-side validation and data checks that client scripts cannot do securely. GlideAjax lets client scripts fetch data from Script Includes, keeping logic reusable and secure.                                                                              |
| 3    | <b>Database / Data Storage</b>      | ServiceNow built-in relational database (Incident [incident] table, extended from Task, with the System Dictionary) | Managed by the platform, so no separate database setup is needed. It provides strong relational mapping between Incident, Users, Groups and Choice lists, and stores the fields that the scripts and policies act on.                                                 |
| 4    | <b>Cloud / Hosting / Deployment</b> | ServiceNow Personal Developer Instance (PDI) – cloud-hosted                                                         | Free, always-available cloud instance for building and testing. It needs no server management and provides a full ServiceNow environment, including the Now Platform tools and Script Debugger.                                                                       |

| S.No | Architecture Component / Layer | Technology Chosen                                                                    | Justification / Purpose                                                                                                                                                         |
|------|--------------------------------|--------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5    | Version Control & CI/CD        | Update Sets (primary); optional GitHub through ServiceNow Studio source control      | Update Sets capture the Client Script and UI Policy changes so they can be moved between instances. GitHub integration adds version history and collaboration for team members. |
| 6    | Third-Party APIs / Other Tools | ServiceNow REST Table API, Script Debugger / JavaScript Log, browser Developer Tools | The REST Table API is used to create and test Incident records. The debugging tools help verify that Client Script and UI Policy behavior works as expected on the form.        |
