

Problem-Solution Fit

Date	01 October 2026
Team ID	6ab2251f18c49545982255a8
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	5 Marks

Problem Statement:

Service desk agents in ServiceNow create and update incidents on a static form that does not guide or validate their input. Required details are missed, fields appear at the wrong time, and errors surface only after the record is saved. This leads to incorrect priority and routing, repeated reassignment, SLA breaches and frustrated agents and users. The team needs client-side logic on the Incident form, built with Client Scripts and UI Policies, that validates data in real time and adapts the form to the incident state, within the existing platform and budget.

Problem-Solution Fit Canvas:

1. CUSTOMER SEGMENT(S) [CS] - L1/L2 service desk agents who log and update incidents - End users / callers reporting issues via Service Portal or phone - ServiceNow admins & developers who maintain the Incident form - Incident/process managers who review data quality & SLAs	6. CUSTOMER LIMITATIONS EG. BUDGET, DEVICES [CL] - No budget for third-party validation or form tools; must use out-of-box platform features - Agents use desktops, while callers use mobile / Service Portal - Limited scripting skills in the support team - Form must stay fast; no extra server round trips	5. AVAILABLE SOLUTIONS PROS & CONS [AS] - Manual checks / agent training: no setup, but inconsistent and not scalable - Business Rules / Data Policy: enforce data on server, but errors appear only after save - Mandatory flag in dictionary: simple, but applies always and cannot be conditional - Third-party apps: rich features, but costly and extra maintenance
2. PROBLEMS / PAINS + ITS FREQUENCY [PR] - Incidents saved with missing or vague Short description, Category, Impact / Urgency (daily, every shift) - Wrong priority and routing because fields are not validated (daily) - Resolution / closure fields visible or editable at the wrong state (every incident) - Tickets reassigned or reopened for missing information (weekly)	9. PROBLEM ROOT / CAUSE [RC] - Incident form is static, with no real-time, client-side validation - No dependency between fields (Category > Subcategory, State > Close notes) - Conditional field behavior (mandatory / hidden / read-only) is not configured - Mistakes are found only after save, during review or SLA breach	7. BEHAVIOR + ITS INTENSITY [BE] - Agents rush to save and skip optional fields (High) - Copy-paste of generic descriptions to close quickly (Medium) - Callers phone again to chase status or correct details (High) - Managers manually audit incidents for quality (Medium)
3. TRIGGERS TO ACT [TR] - SLA breach alerts and rising backlog - P1 / P2 incident routed to the wrong team - Audit or quality report flags incomplete incident data - Complaints from users about repeated follow-ups	10. YOUR SOLUTION [SL] - Client Script (onLoad): set defaults and show guidance message on a new Incident - Client Script (onChange): Category > filter Subcategory; Impact + Urgency > validate priority - Client Script (onSubmit): block save with a clear message if Short description is too short or key fields are empty - UI Policy: make Close code & Close notes mandatory when State = Resolved / Closed - UI Policy: hide Resolution fields until State = Resolved; read-only once Closed - Result: real-time guidance, consistent data, fewer reassignments	8. CHANNELS OF BEHAVIOR [CH] ONLINE - ServiceNow Incident form (Platform UI) - Service Portal / Employee Center - ServiceNow mobile app - Email-to-incident and chat
4. EMOTIONS BEFORE / AFTER [EM] - Before: frustrated, stressed, confused, worried about SLAs - After: confident, in control, relieved, trusting the system		OFFLINE - Phone calls and walk-ups to the service desk - Verbal and written shift-handover notes - Review and CAB meetings
