

Solution Architecture

Date	01 October 2026
Team ID	6ab2251f18c49545982255a8
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	5 Marks

Solution Architecture Diagram:

High-level architecture of the Incident form solution, showing how Client Scripts and UI Policies work across the Presentation, Application and Data layers of ServiceNow.

Component Description Table

Component Name	Description / Role in Architecture	Technologies Used
Presentation Layer	Where agents and users create and update incidents. Client Scripts and UI Policies run here in the browser to validate input and change the form instantly.	Incident form (Platform UI), Service Portal, ServiceNow Mobile App
Client-Side Logic Layer (replaces API Gateway)	Handles form events. onLoad sets defaults, onChange links fields (Category and Subcategory), onSubmit blocks incomplete records. UI Policies make fields mandatory, hidden or read-only based on State.	Client Scripts, UI Policies, GlideForm (g_form), GlideUser (g_user), JavaScript
Auth & Access Service	Controls who can view or edit incident fields and scripts, and applies roles to the form behavior.	Roles, ACLs, User Session / SSO
Core Logic Service (Microservices equivalent)	Server-side services for checks that need data from the server, and a safety net so rules are still enforced if the client is bypassed.	Business Rules, Script Includes, GlideAjax
Platform Integrations	Moves changes between instances and sends alerts about incidents.	Update Sets, Email Notifications, Flow Designer
Database	Stores incident records, choice values and the configuration of Client Scripts and UI Policies.	ServiceNow Database: incident, sys_choice, sys_script_client, sys_ui_policy
