

## Solution Architecture

|                      |                                                                      |
|----------------------|----------------------------------------------------------------------|
| <b>Date</b>          | 05-10-2026                                                           |
| <b>Team ID</b>       | 6ab2256ffc67a5bc022256a7                                             |
| <b>Project Name</b>  | Script_ Controlled ACL _ Restrict Record Access Based on Field Value |
| <b>Maximum Marks</b> | 5 Marks                                                              |

### Solution Architecture Diagram:

Provide a high-level visual representation of your solution's architecture. Use the structural layout below as a template to map out your Presentation Layer, Application Layer, and Data Layer. Fill in the specific technologies and components for your project directly into the boxes to create your architectural diagram.

### Component Description Table

| Component Name                    | Description / Role in Architecture                                                                                                            | Technologies Used                                                                            |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
| Presentation Layer                | Provides the interface for end-users, agents, and API clients attempting to view, create, or update records.                                  | ServiceNow Workspace, Service Portal, Postman REST Client                                    |
| API Gateway & Auth                | Handles incoming client requests, authenticates users, and routes operation requests (write/update/delete) to the security evaluation engine. | ServiceNow REST API Gateway, OAuth 2.0 / Session Auth                                        |
| Core Logic Service (Scripted ACL) | Evaluates dynamic script conditions against target record field values (e.g. `current.state != 'Closed'`) before granting access.             | Server-Side JavaScript, GlideRecord API, ServiceNow Access Control (sys_security_acl)        |
| Audit & Security Service          | Logs access evaluation decisions, security violations, and unauthorized attempt logs for compliance audits.                                   | ServiceNow System Logs (`syslog`), Audit Table (`sys_audit`)                                 |
| Data / Storage Layer              | Stores target business records (Incidents, Tasks) and stores ACL security definitions and field dictionary definitions.                       | ServiceNow Relational Database (MariaDB/MySQL engine underpinning `incident`, `task` tables) |
