Project Name	Script_ Controlled ACL _ Restrict Record Access Based on Field Value
Maximum Marks	5 Marks

Coding & Solution

This section evaluates the quality and completeness of your implemented code and the overall solution. Your submission should demonstrate working functionality, clean code practices, and alignment with your defined requirements.

Instructions:

1. Ensure your code is well-structured, commented, and follows best practices for your chosen technology stack.
2. The solution should address the core problem statement and implement the key functional requirements.
3. Include all source files, configuration files, and setup instructions needed to run the application.
4. Attach or link to your code repository (e.g., GitHub) in the table below.

Solution Summary

Field	Details
Repository Link / URL	https://github.com/SafrinBanuS/Script_Controlled_ACL_Restrict_Record_Access
Programming Language(s)	JavaScript (ServiceNow Server-side & Client-side)
Framework(s) Used	ServiceNow Platform (GlideSystem API, GlideRecord, ACL Engine)
Key Features Implemented	1. Script-controlled ACL write restriction based on record field values (e.g., State = Closed). 2. Server-side GlideSystem validation (answer = current.state != 'Closed') preventing unauthorized record editing. 3. Modular Script Include encapsulation for reusable security evaluations across tables. 4. Role-based overrides for System Security Administrators.
Pending / Incomplete Features	None (All functional requirements fully implemented and tested across UI and API channels).
Setup / Run Instructions	1. Import the Update Set XML into your ServiceNow Developer Instance. 2. Commit Update Set and verify ACL rule activation on the target table. 3. Impersonate a regular user role and verify write restrictions on closed records. 4. Perform REST API POST/PUT requests to confirm backend security evaluation.

Code Quality Checklist

S.No	Criteria	Status (Yes / No)
1	Code is modular and organized into functions / classes	Yes
2	Meaningful variable and function names are used	Yes
3	Code includes comments / documentation where necessary	Yes
4	Error handling is implemented for critical operations	Yes
5	The application runs without critical errors	Yes
6	Code is committed to a version control repository	Yes

Additional Notes / Comments:

The scripted Access Control List (ACL) implementation strictly enforces access rules at the database level, ensuring record protection regardless of whether access attempts originate from UI forms, REST APIs, or background scripts. Unit tests were executed using ServiceNow Automated Test Framework (ATF) to validate access restrictions across all user roles and record field state transitions.
